Qorloop Phase 1 Development Plan

Oct 22, 2026 · @Globify Dev

By Nov 20, 2026, Qorloop runs on staging with real accounts, a real database and real client files, ready for testing.

What we're building

Phase 1 turns the front-end demo, which runs on mock data in the browser, into the real product: accounts, a database, server-side file processing and reconciliation. The design is partially approved. Build the flows on the current screens; some visuals may still change, but the flows won't.

Deployment model

- Each supermarket or business gets **its own Qorloop instance on its own subdomain** (e.g. `dohafresh.qorloop.com`), with its own database, storage, secrets and backups.
- The product shows no tenant concept: no public sign-up, no business switcher, no plans or billing. We create the instance with one provisioning command and invite the customer's Owner.
- **Underneath, the code is tenant-ready** so it can later run many customers in one shared SaaS without a rewrite:
  - `tenant_id` on every customer table, and in unique keys
  - UUID primary keys
  - one tenant resolver (from config now, from the subdomain later)
  - one data-access layer that always scopes by tenant
  - tests that run two tenants in one database
- This is internal engineering. It does not show anywhere in the product.

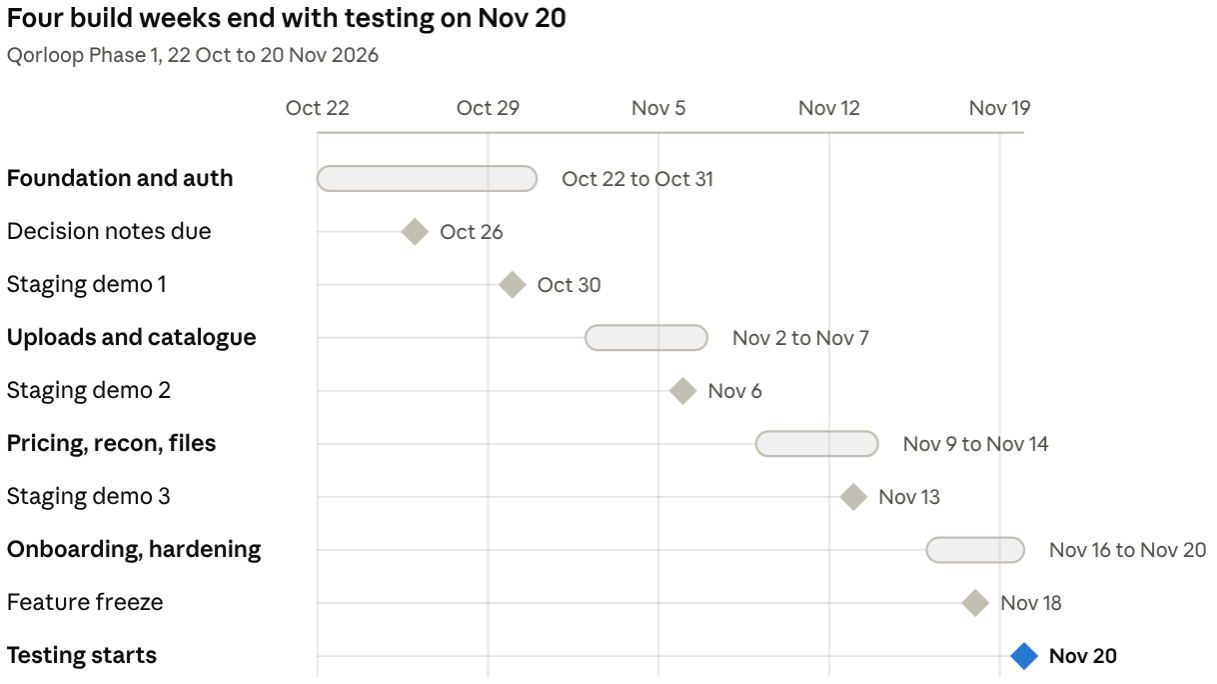

In scope by 20 Nov

- **Accounts and access:** Owner invitation, login, two-step verification (TOTP), password reset, team invites, and four roles (Owner, Admin, Catalogue Manager, Analyst) enforced on the server
- **Onboarding wizard:** store, marketplaces, ERP file, marketplace files
- **Uploads:** ERP and marketplace files, column mapping, review, apply, history and row errors
- **Catalogue:** all products, product detail, new products, categories and subcategories
- **Marketplace Price:** default, category, product and offer rules, plus bulk changes

- **Reconciliation:** the dashboard and the stock and price reports, with the compare-against toggle
- **Generated files:** Talabat, Snoonu and Rafeeq formats, with a preview before generating
- **Settings:** general rules, marketplaces, team, basic security
- **Provisioning:** one command creates a customer instance; one release job updates every instance

Not in this phase: public sign-up, a platform admin app, marketplace APIs, analytics reports, the Qatar compliance add-on, dark mode and an Arabic UI.

Timeline at a glance

Phase 1 timeline · 4 build weeks, weekly staging demos

Each week ends with a staging demo, feature freeze is Wed 18 Nov, and testing starts Fri 20 Nov.

Week 1: foundation and auth (Thu 22 Oct – Sat 31 Oct)

Auth goes first. It is the top priority this week, and everything else depends on it.

- [ ] **F1** Tag the current `main` as `demo-v1`, so the offline client demo can always be run again.
- [ ] **F2** Decision notes in `docs/decisions/` by **Mon 26 Oct**:

  - API framework (NestJS or Fastify)
  - ORM (Prisma or Drizzle)
  - auth library (Better Auth recommended)
  - hosting, plus the provisioning tool (Terraform, Pulumi or a script)
  - job queue
  - email provider
- [ ] **F3** Monorepo: `apps/web` (the current app, still building), `apps/api`, `apps/worker`, `packages/core`, `packages/db`, `packages/shared`, `infra/`.
- [ ] **F4** Move the business logic from `src/demo` and `src/lib/pricing.ts` into `packages/core`. Merge it into one pricing model (Marketplace Price), use money-safe arithmetic, and keep the tests green.
- [ ] **F5** Postgres schema v1, following the tenant-ready rules: UUIDs, `tenant_id`, a tenant resolver and a scoped data layer. Add migrations and a seed script.
- [ ] **F6** CI (lint, typecheck, test) on every PR, and automatic deploys of `main`. Add Sentry and structured logs. No secrets in git.
- [ ] **F7** Web plumbing:
  - React Router with real URLs
  - a typed API client and TanStack Query
  - blueprint colours and fonts as design tokens
- [ ] **F8** Provisioning script, first version: one command creates an instance with its subdomain, TLS, database, bucket, secrets, deploy, migrations, tenant row and an Owner invitation. Use it to create **staging**.
- [ ] **A1** First Owner by invitation; accepting it verifies their email.
- [ ] **A2** Login and logout, forgot and reset password, session timeouts, the session-expired page.
- [ ] **A3** TOTP two-step verification with recovery codes, mandatory for Owners.
- [ ] **A4** Team: invite by email and role, accept, change role, remove. An Admin can't grant Owner.
- [ ] **A5** Roles: one permission map, enforced on the server for every endpoint. The web app hides what a role can't do.
- [ ] **A6** Tenant-safety test harness with two tenants in one database, used in every endpoint test.

Exit, Fri 30 Oct:

1. Staging has been created by the provisioning script.
2. I accept the Owner invitation and set up MFA.
3. I invite a Catalogue Manager.

4. I log in as them and see only what that role allows.

Week 2: uploads and catalogue (Mon 2 Nov – Sat 7 Nov)

- [ ] **U1** Upload API: a signed upload URL, the upload record, a background job, status and progress for polling.
- [ ] **U2** Worker:
  - safety checks (.xlsx, .xls, .csv only; 25 MB; no macros or encryption)
  - parse the file and detect its layout
  - validate rows and store row errors
  - reject the file when more than 20% of rows are invalid
- [ ] **U3** Column mapping: suggestions, a versioned saved mapping, and the wrong-file guard ("This looks like a Snoonu file").
- [ ] **U4** Review and apply:
  - summary and tabs
  - an idempotent apply
  - ERP never overwrites fields managed in Qorloop
  - an activity log entry per change
  - first ERP import makes all products active
- [ ] **U5** Upload history, and row errors as an .xlsx download.
- [ ] **C1** Products API: cursor pagination, search (name, barcode, SKU), filters and tabs, detail, and editing of Qorloop-managed fields.
- [ ] **C2** Categories and subcategories, plus a guessed category from the ERP's category text.
- [ ] **C3** New products: inline Arabic name and category, then activate the selected rows.
- [ ] **W2** Connect these screens to the API, with loading, empty and error states.

Exit, Fri 6 Nov:

1. Upload a real ERP file (10k+ rows) and real marketplace files on staging.
2. Map the columns the first time.
3. Review and apply.
4. The products show in the catalogue. The second upload of the same layout is recognised automatically.

Week 3: pricing, reconciliation, reports and files (Mon 9 Nov – Sat 14 Nov)

- [ ] **P1** Marketplace Price:
  - default, category and subcategory, product and offer rules
  - the advanced per-marketplace option, off by default
  - each product's resolved price and its source
- [ ] **P2** Bulk price changes for a selection or a whole category, with a preview, plus inline edit in the catalogue.
- [ ] **P3** *(stretch)* Bulk price file: download the template, upload, per-row review, apply.
- [ ] **R1** Reconciliation worker: recompute after every applied upload or price change, store flags for both references (ERP and Marketplace Price), and stay correct at 50k products.
- [ ] **R2** Dashboard:
  - source cards with freshness and stale warnings
  - mismatch tiles (total = stock + price)
  - needs attention
  - "No file yet" where a marketplace has no data
- [ ] **R3** Stock and price reports:
  - server-side filters and pagination
  - the compare-against toggle
  - the same counts as the dashboard
  - read-only
- [ ] **G1** Generate files:
  - preview (count, changes, largest change, first 10 rows), then a generate job and a signed download
  - 30-day history
  - Talabat, Snoonu and Rafeeq formats
  - spreadsheet formula-injection escaping
- [ ] **G2** Category mapping (Qorloop category to marketplace category), needed for new-product files.

Exit, Fri 13 Nov:

1. The whole daily loop runs on staging with real files.
2. The dashboard, reports, product detail and generated files all show the same numbers.
3. The compare toggle changes the counts as expected.

Week 4: onboarding, settings, hardening and handover (Mon 16 Nov – Fri 20 Nov)

- [ ] **O1** Onboarding wizard on the API, after the Owner's first login: store, marketplaces, ERP file, marketplace files, then results. It resumes at the saved step.
- [ ] **S1** Settings:
  - general rules: price tolerance, stock threshold, stale window
  - marketplaces on/off
  - upload formats, read-only
  - security: require MFA for all, Analyst export
- [ ] **S2** Product history, plus a basic activity log.
- [ ] **S3** Re-auth before sensitive actions; 404, 403 and 500 pages with a request ID; an offline banner.
- [ ] **F9** Provisioning, final version:
  - create a second instance from scratch with one command
  - a release job that deploys and migrates every instance
  - an instance list with version, health and last backup
- [ ] **Q1** Tests:
  - unit tests for `packages/core`
  - API integration tests
  - tenant safety on every endpoint group
  - a Playwright smoke test: accept invitation → onboarding → upload → review → report → generate
- [ ] **Q2** Performance:
  - a 50k-row ERP file is processed and applied in under 3 minutes
  - catalogue and report pages respond in under 1 s
- [ ] **Q3** Security:
  - rate limits on auth endpoints, security headers, cookie flags
  - `npm audit`
  - private buckets
  - backups on, and one restore tested
- [ ] **D1 Wed 18 Nov:** feature freeze. Only fixes after this.
- [ ] **D2 Thu 19 Nov:** final staging deploy, with a test tenant, one account per role and the client sample files loaded.
- [ ] **D3 Fri 20 Nov:** hand over for testing: staging URL, test accounts, test checklist, known-issues list.

Definition of done for 20 Nov

On staging, with real files from the client:

1. One command creates a new customer instance on its own subdomain. The Owner accepts the invitation, sets up MFA, completes onboarding and invites a team member.
2. Each role sees and can do only what it should, and the server rejects everything else.
3. ERP and marketplace files (up to 25 MB / 50k rows) upload, are recognised or mapped once, show a correct review, and apply.
4. The dashboard, stock report, price report and product detail show the same numbers. Stock is compared as availability (True/False), not quantity.
5. Marketplace Price rules, bulk changes and the compare-against toggle work.
6. Corrected Talabat, Snoonu and Rafeeq files download in the exact marketplace format, after a preview.
7. Each customer's data lives only in its own instance, and tests prove the code is tenant-safe for the future shared SaaS.
8. CI is green, errors reach Sentry, and backups run.

Inputs Globify will provide

If anything arrives late, build on the default in `docs/08-open-questions.md` and keep going.

By	What	Needed for
Mon 26 Oct	Real sample files: ERP exports from 2–3 retailers, plus each marketplace's export and bulk upload format	Parsing, matching, output formats
Mon 26 Oct	Hosting region, main domain for customer subdomains, email sending domain	Staging, provisioning, invitation emails
Mon 26 Oct	Which screens are design-approved	Avoiding visual rework
Mon 2 Nov	Category list: fixed or merchant-defined, and subcategory required? Keeta or Jahez?	Schema, seed data, onboarding
Mon 9 Nov	Pricing rule order, offer expiry, bulk file key (barcode or SKU), rounding options	Pricing engine

Cut list if time runs short

Cut in this order, and tell me as soon as a cut looks likely:

1. Bulk price **file** import (bulk changes from the UI stay)
2. "Download report" export
3. The advanced per-marketplace pricing UI (keep the data model)
4. The activity log list page (keep logging the events)
5. The offline banner and polish on the onboarding results screen
6. Any marketplace without a confirmed file format

Never cut:

- auth with MFA
- roles enforced on the server
- the tenant-ready data layer
- the provisioning script
- upload → review → apply
- correct reconciliation
- preview before generating files

How we work

- **Branches:** feature branches and pull requests into `main`, small and often. Reference task IDs in commits (e.g. `A3: TOTP enrolment`).
- **Daily update:** at the end of each day, write done / next / blocked.
- **Friday demos:** a 30-minute demo on staging on 30 Oct, 6 Nov and 13 Nov.
- **Blockers:** raise them the same day. If a rule in the docs looks wrong, ask rather than guess.
- **NDA:** the codebase is under NDA. Never put real client files or secrets in git.

Full documentation is in the repo (github.com/globifydeveloper-star/Qorloop). Start with `README.md`, then `docs/`:

- product overview
- current front end
- architecture and deployment model
- data model
- business rules
- the detailed version of this plan

- later phases
- open questions
- screen inventory

The UX blueprint PDF is in `docs/reference/`.
